Chemical Solution Deposition Science

Here, we present a chemical solution deposition methodology to produce 2D arrays of cobalt ferrite (CFO) nanodots on Si substrates. Using thin films of four different self-assembled block copolymers as templates, ordered arrays of nanodots with four different characteristic dimensions were fabricated.

The buffer layers were also prepared by a chemical solution deposition (CSD) route, and this all-CSD route shows good potential for low cost long length industrial production. On single crystal substrates, both TFA- and water-based precursors have been printed, producing well textured coatings with J c values up to 3 MA cm⁻². Multi-filamentary structures and even arbitrary patterns have been successfully prepared, demonstrating the potential for ink-jet printing to directly deposit the ...

The growth of superconducting epitaxial YBCO layers by means of a chemical solution deposition process is a complex one which involves three different stages, as schematically depicted in figure 6: the pyrolysis step, the growth process, and finally the samples are subjected to an oxygenation annealing step. After preparation and deposition of the metal–organic precursor solutions, a first thermal treatment which will pyrolyze all the organic content in the precursor is applied.

This study was the first to realize ferroelectric properties in undoped HfO2 films by the chemical solution deposition method, which broke the above restrictions while using the ALD method. The evolution of ferroelectricity in pure HfO2 films was studied over a wide range of thickness from 34 nm to 136 nm, without doping any other metallic elements.
