According to Cook’s interview with Witkowski, this device contained two counter-rotating cylinders that would be “filled with a substance similar to mercury, violet in color”. This metallic liquid was codenamed “Xerum 525” and was “stored in a tall, thin thermos, one meter high and encapsulated in lead.”

Similarly, liquid mercury was used as a coolant for some nuclear reactors; however, sodium is proposed for reactors cooled with liquid metal, because the high density of mercury requires much more energy to circulate as coolant. Mercury was a propellant for early ion engines in electric space propulsion systems.
