Dynamical Systems & Lyapunov Stability I have a problem with this exercise given by the professor for home. It's about Lyapunov equation and autonomous systems. Here it is: Prove that if the state of equilibrium  $x^* = 0$  ( $x^* \in \mathbb{R}^n$ ) of the system:  $\dot{x}(k+1) = e^A x(k)$  with  $A \in \mathbb{R}^{n \times n}$  is asymptotically stable then even the equilibrium state  $x^* = 0$  of the system:  $\dot{x} = Ax(t)$  is asymptotically stable.

autonomous systems Lyapunov - Mathematics Stack Exchange Abstract. Finite-time stability involves dynamical systems whose trajectories converge to a Lyapunov stable equilibrium state in finite time. In this paper, we address finite time stability of discrete-time dynamical systems. Specifically, we show that finite time stability leads to uniqueness of solutions in forward time.

Finite-time stability of discrete autonomous systems ... to prove stability of origin for  $\dot{x} = -\alpha|x|^\beta$  because your system has time varying parameters. It is autonomous, and time varying. What you need to do is to construct a time varying Lyapunov function, and in the process you will encounter when a Lyapunov function is said to be descrecent, etc. Those are not a part of the classical Lyapunov theory, which deals with time-invariant, autonomous system.
