In many fields, the words parallel and concurrent are synonyms; not so in programming, where they are used to describe fundamentally different concepts. A parallel program is one that uses a multiplicity of computational hardware (e.g., several processor cores) to perform a computation more quickly. The aim is to arrive at the answer earlier, by delegating different parts of the computation to different processors that execute at the same time.

A system is said to be concurrent if it can support two or more actions in progress at the same time. A system is said to be parallel if it can support two or more actions executing simultaneously. The key concept and difference between these definitions is the phrase "in progress." This definition says that, in concurrent systems, multiple actions can be in progress (may not be executed) at the same time.

Parallel Programming Describes a task-based programming model that simplifies parallel development, enabling you to write efficient, fine-grained, and scalable parallel code in a natural idiom without having to work directly with threads or the thread pool. Threading Describes the basic concurrency and synchronization mechanisms provided by .NET.

Concurrency Parallelism; 1. Concurrency is the task of running and managing the multiple computations at the same time. While parallelism is the task of running multiple computations simultaneously. 2. Concurrency is achieved through the interleaving operation of processes on the central processing unit(CPU) or in other words by the context switching.

Remember that only the parallel approach takes advantage of multi-core processors, whereas concurrent programming intelligently schedules tasks so that waiting on long-running operations is done while in parallel doing actual computation.

[Introduction to Parallel and Concurrent Programming in Python](#)

Parallel programming is a broad concept. It can describe many types of processes running on the same machine or on different machines. Multithreading specifically refers to the concurrent execution of more than one sequential set (thread) of instructions. Multithreaded programming is programming multiple, concurrent execution threads.

[What Is Parallel Programming & Multithreaded Programming ...](#)

Parallel programming is to specifically refer to the simultaneous execution of concurrent tasks on different processors or cores. Thus, all parallel programming is concurrent, but not all concurrent programming is parallel. Also, every language comes with its own characteristics and functionality.

Concurrent Execution¶. The modules described in this chapter provide support for concurrent execution of code. The appropriate choice of tool will depend on the task to be executed (CPU bound vs IO bound) and preferred style of development (event driven cooperative multitasking vs preemptive multitasking).

For instance, when one task is waiting for user input, the system can switch to another task and do calculations. When tasks don't just interleave, but run at the same time, that's called parallelism. Multiple CPU cores can run instructions simultaneously: AB.

Concurrent computations may be executed in parallel, for example, by assigning each process to a separate processor or processor core, or distributing a computation across a network. In general, however, the languages, tools, and techniques for parallel programming might not be suitable for concurrent programming, and vice versa.
